

Agoda the Online travel platform

Checklist for the Accommodation search feature

Introduction

The project is the [Agoda](#) website. This is an online travel platform that enables customers to make direct reservations online.

This presentation provides a basic checklist for the accommodation search feature. It was designed to ensure the validation of both acceptable and unacceptable values. The accommodation search parameters were decomposed using the Equivalence Classes and Boundary Values test design techniques.

The [Miro](#) tool was used for decomposition. The test data used for testing can be found [here](#).

The [Testomat.io](#) tool was used to create the checklist.

Test run report can be found [here](#).
